

RELIANCE PREDICTIVE SAFETY TECHNOLOGIES

SafePredict

Construction Safety Intelligence

The safety command center built for general contractors.
Every number computed from the record that produced it — and traceable back to it.

Sales Presentation · Steven Sladky, CSP

Reduce Compliance Risk · Improve Field Accountability · Protect Project Timelines

The general contractor carries the risk

Every sub, every crew, every credential on the site is your exposure — and it lives in the places you can see least.

01

Paperwork overload

Permits, JSAs, certs and sign-offs still move on paper and through inboxes across the jobsite.

02

Observations go nowhere

Near-misses get written down and never closed out, so they never become leading indicators.

03

Subs are a spreadsheet

Prequal in one folder, certs in another, insurance in an inbox. Nobody can rank sub risk this morning.

04

Reactive incident response

Teams move after the event instead of using live field signal to prevent the repeat.

05

Training gaps between crews

Expirations surface after the work is already assigned to the worker whose card lapsed.

06

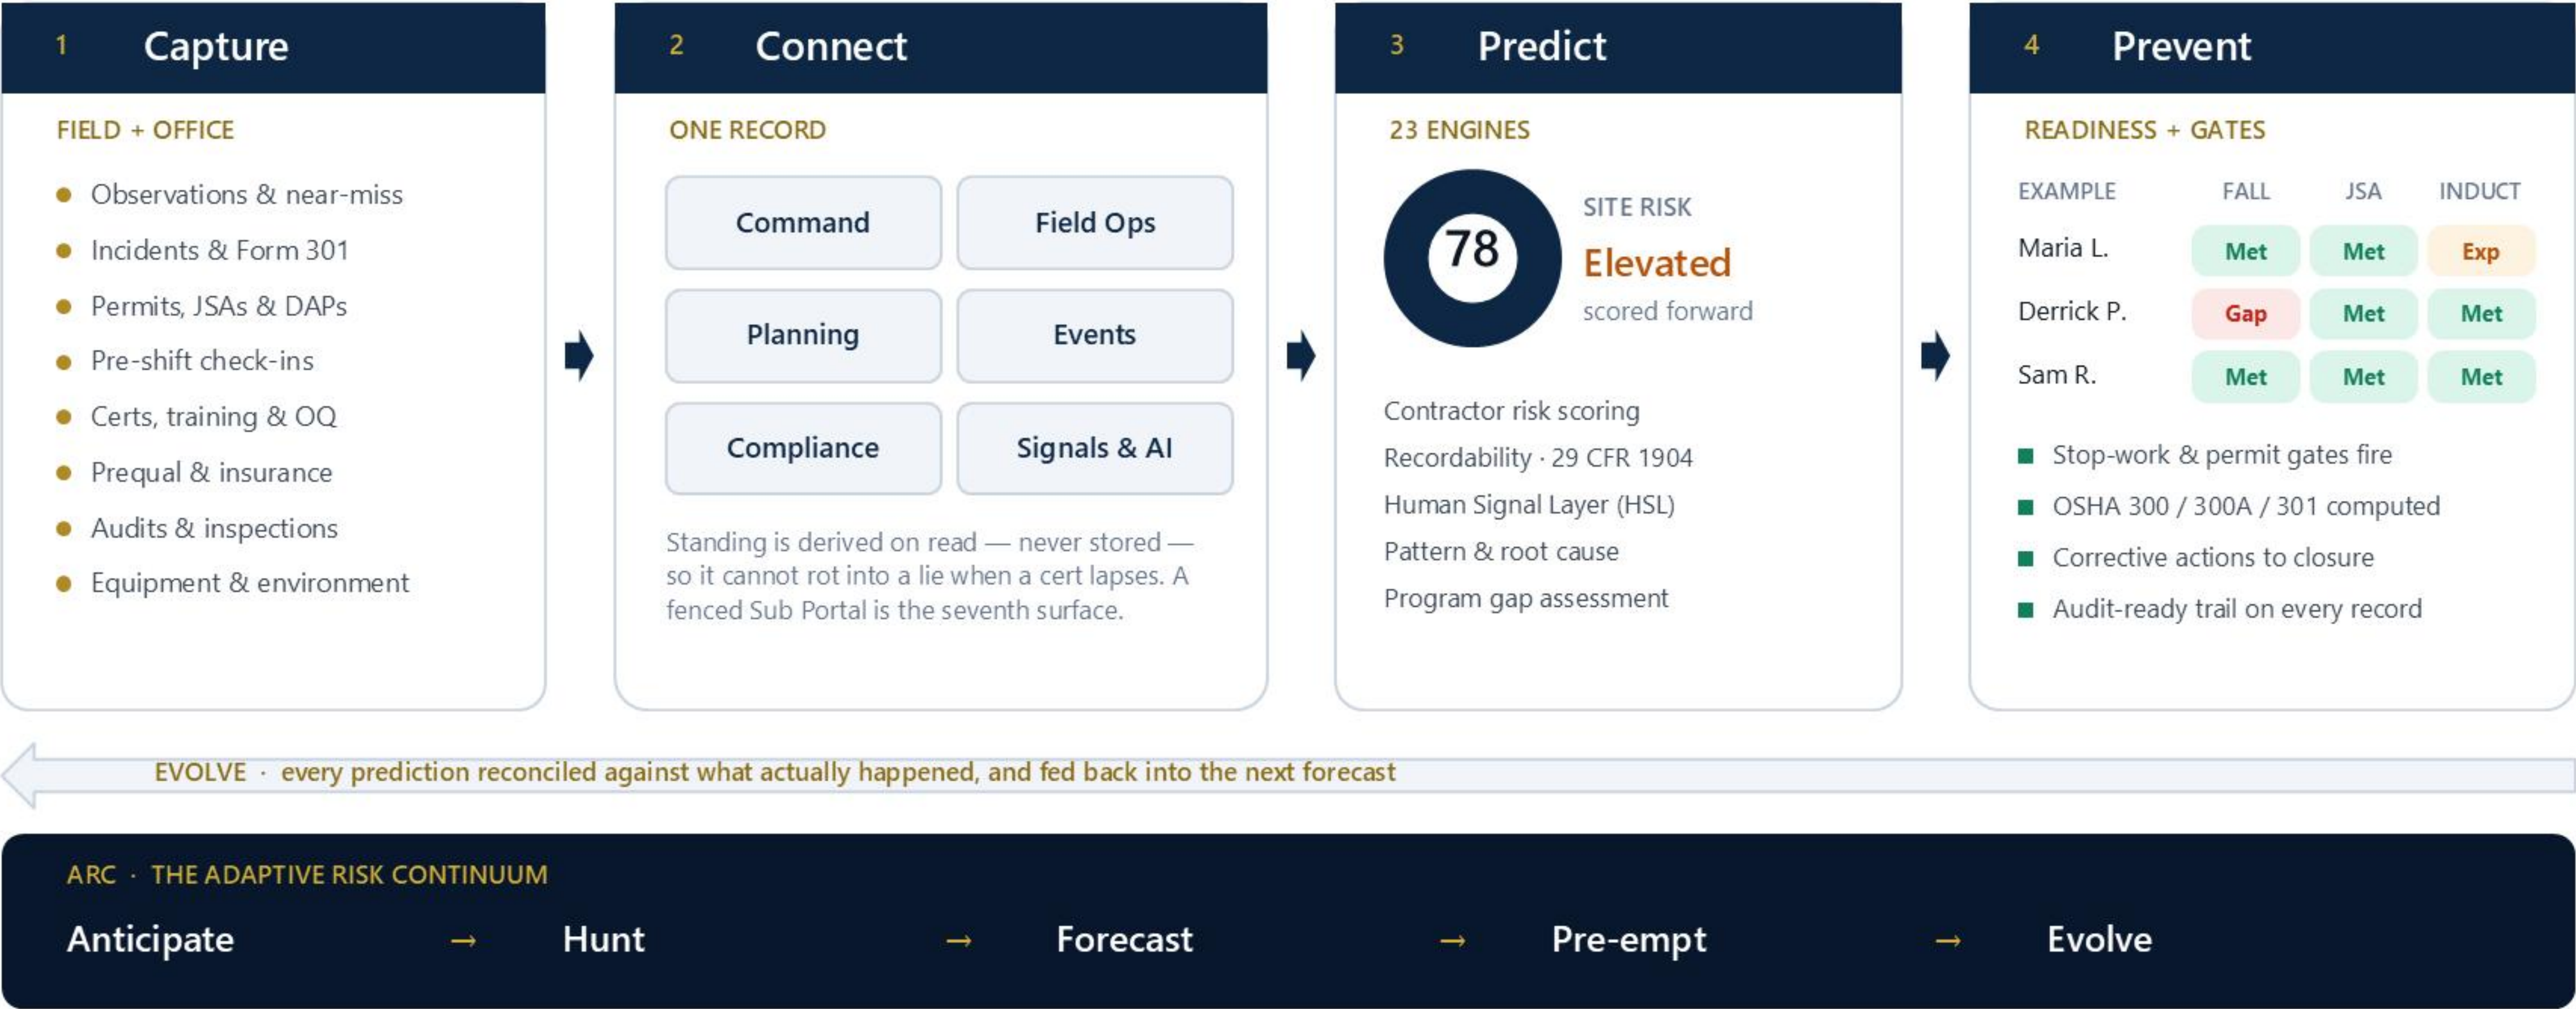

Recordability by debate

Whether a case is OSHA-recordable gets argued case by case, with no written 1904 trail.

The result: slow closeouts, weak visibility, and preventable risk.

Safety data to safety prevention

Every record the field already files, turned into readiness, prediction, and a gate on the work — then reconciled against what actually happened.

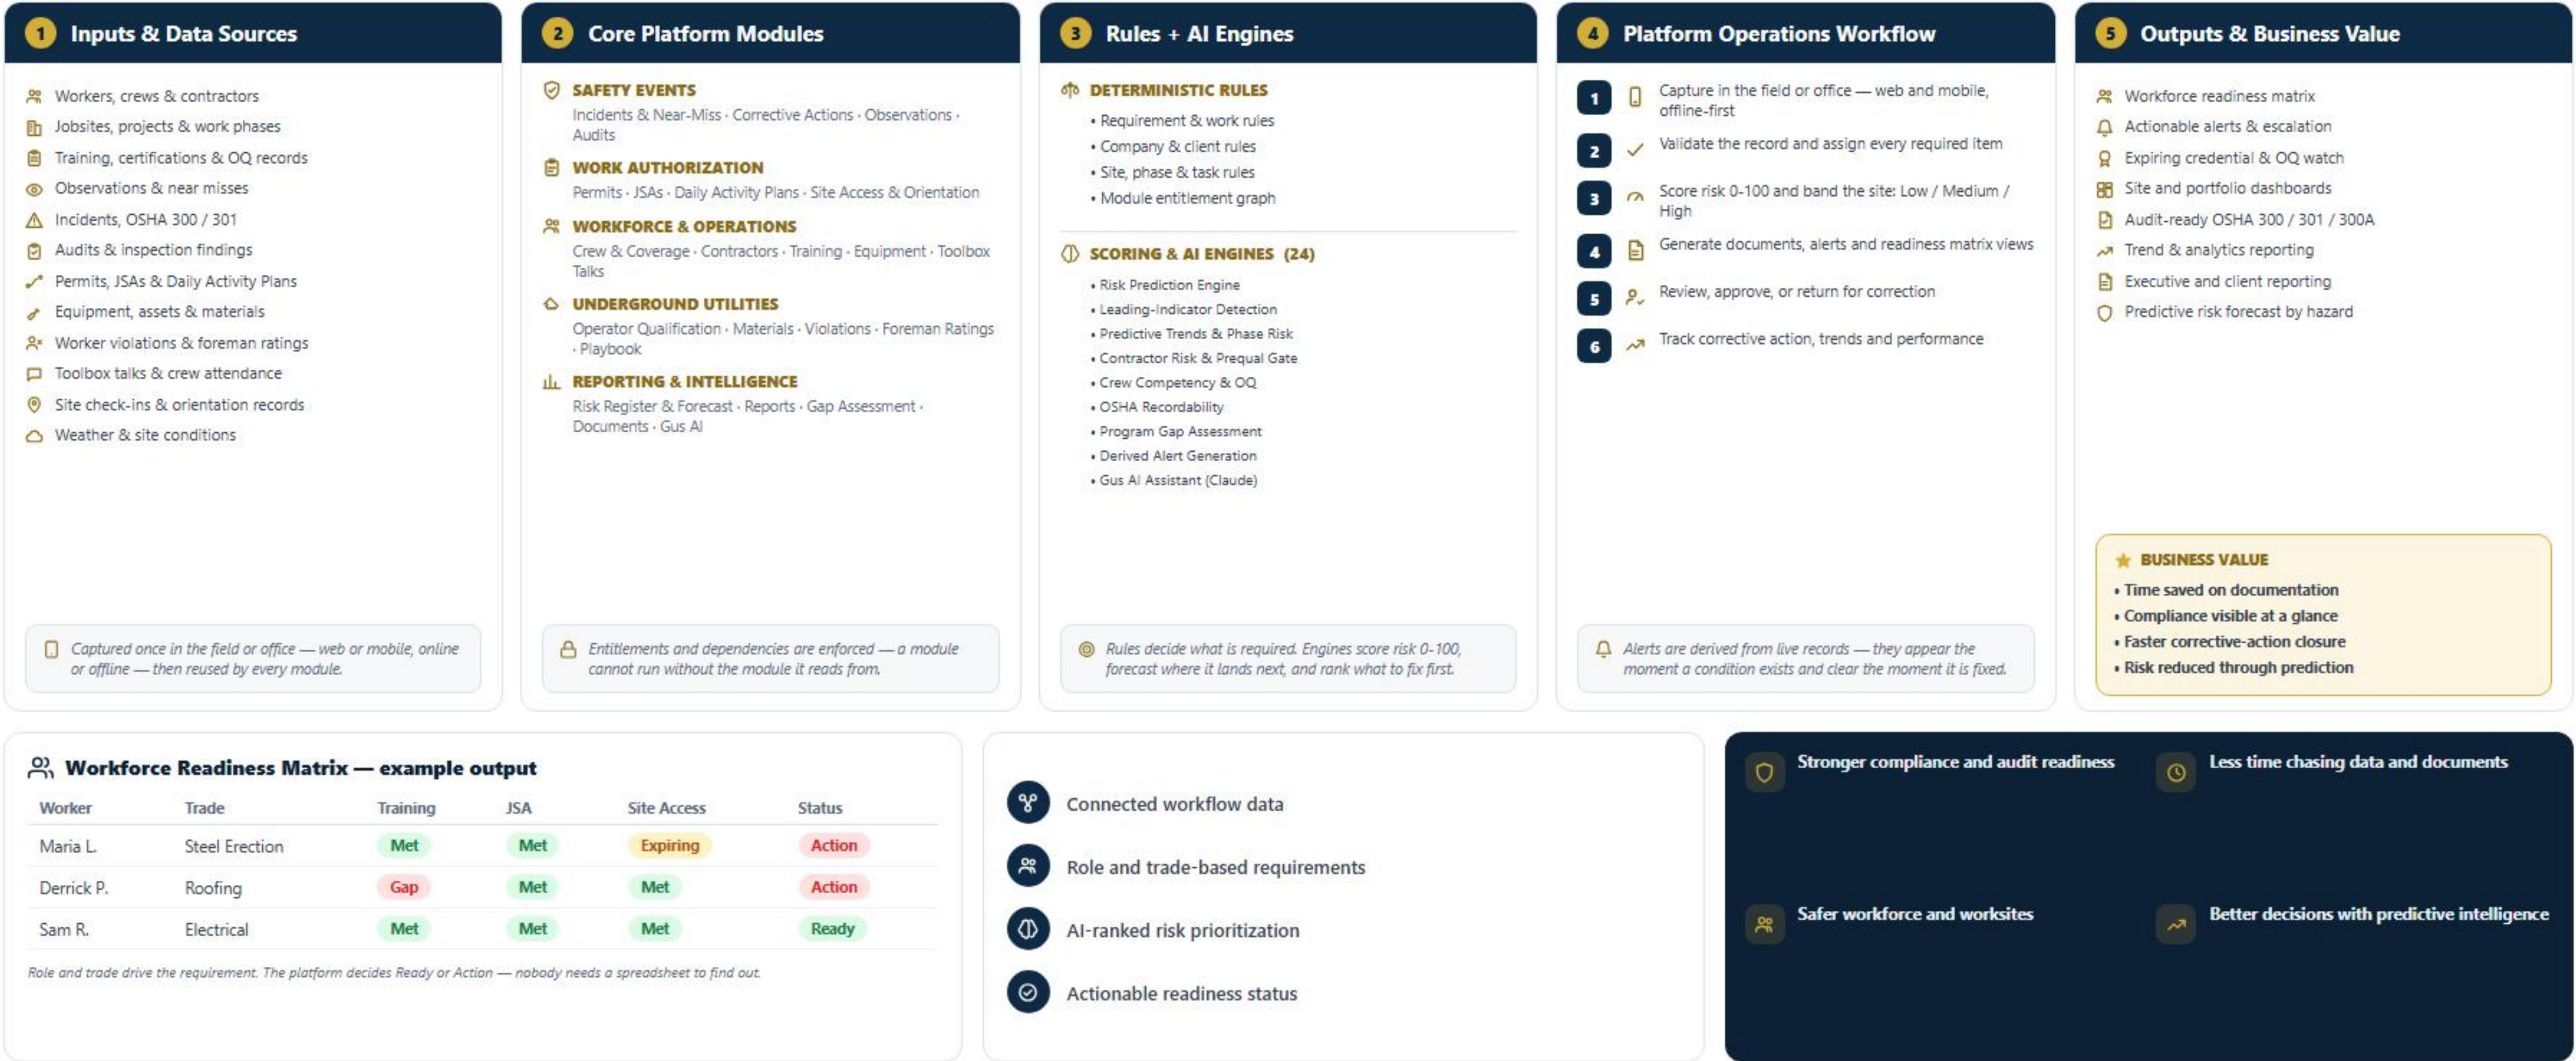

One platform. One record. One step ahead.

Risk score and readiness cells shown are illustrative.

The platform makes safety operations visible, connected, and predictive

23 modules, deterministic rules, and 24 scoring engines turn daily field activity into documents, compliance control, and a forward-looking risk forecast.

Six core platform pillars

A construction safety operating system built for command, field work, planning, response, compliance and signal — every domain live in the product today.

Plus a fail-closed Subcontractor Portal and in-app Help & Support on every screen, for every role — the difference between storing safety data and operating with safety intelligence.

Field-focused, not theoretical

Reliance Predictive Safety Technologies partners with construction, biotech and pharmaceutical teams to strengthen safety programs, prevent injuries, and sustain environmental and regulatory compliance — so every worker goes home healthy and every project meets its goals.

01

Keep people safe

What we deliver

Program assessments, tailored training, site-ready procedures, observation and corrective-action systems, and audit-ready documentation.

02

Projects on schedule

How we work

Alongside crews, supervisors and leadership — building solutions that fit real jobsite workflows and earn sustained adoption.

03

Operations compliant

What makes it different

The consulting practice and the software are the same discipline. SafePredict encodes the program rather than describing it.

SafePredict is how that mission is enforced on a jobsite, every day, in software.

Twenty-three engines. Every one deterministic.

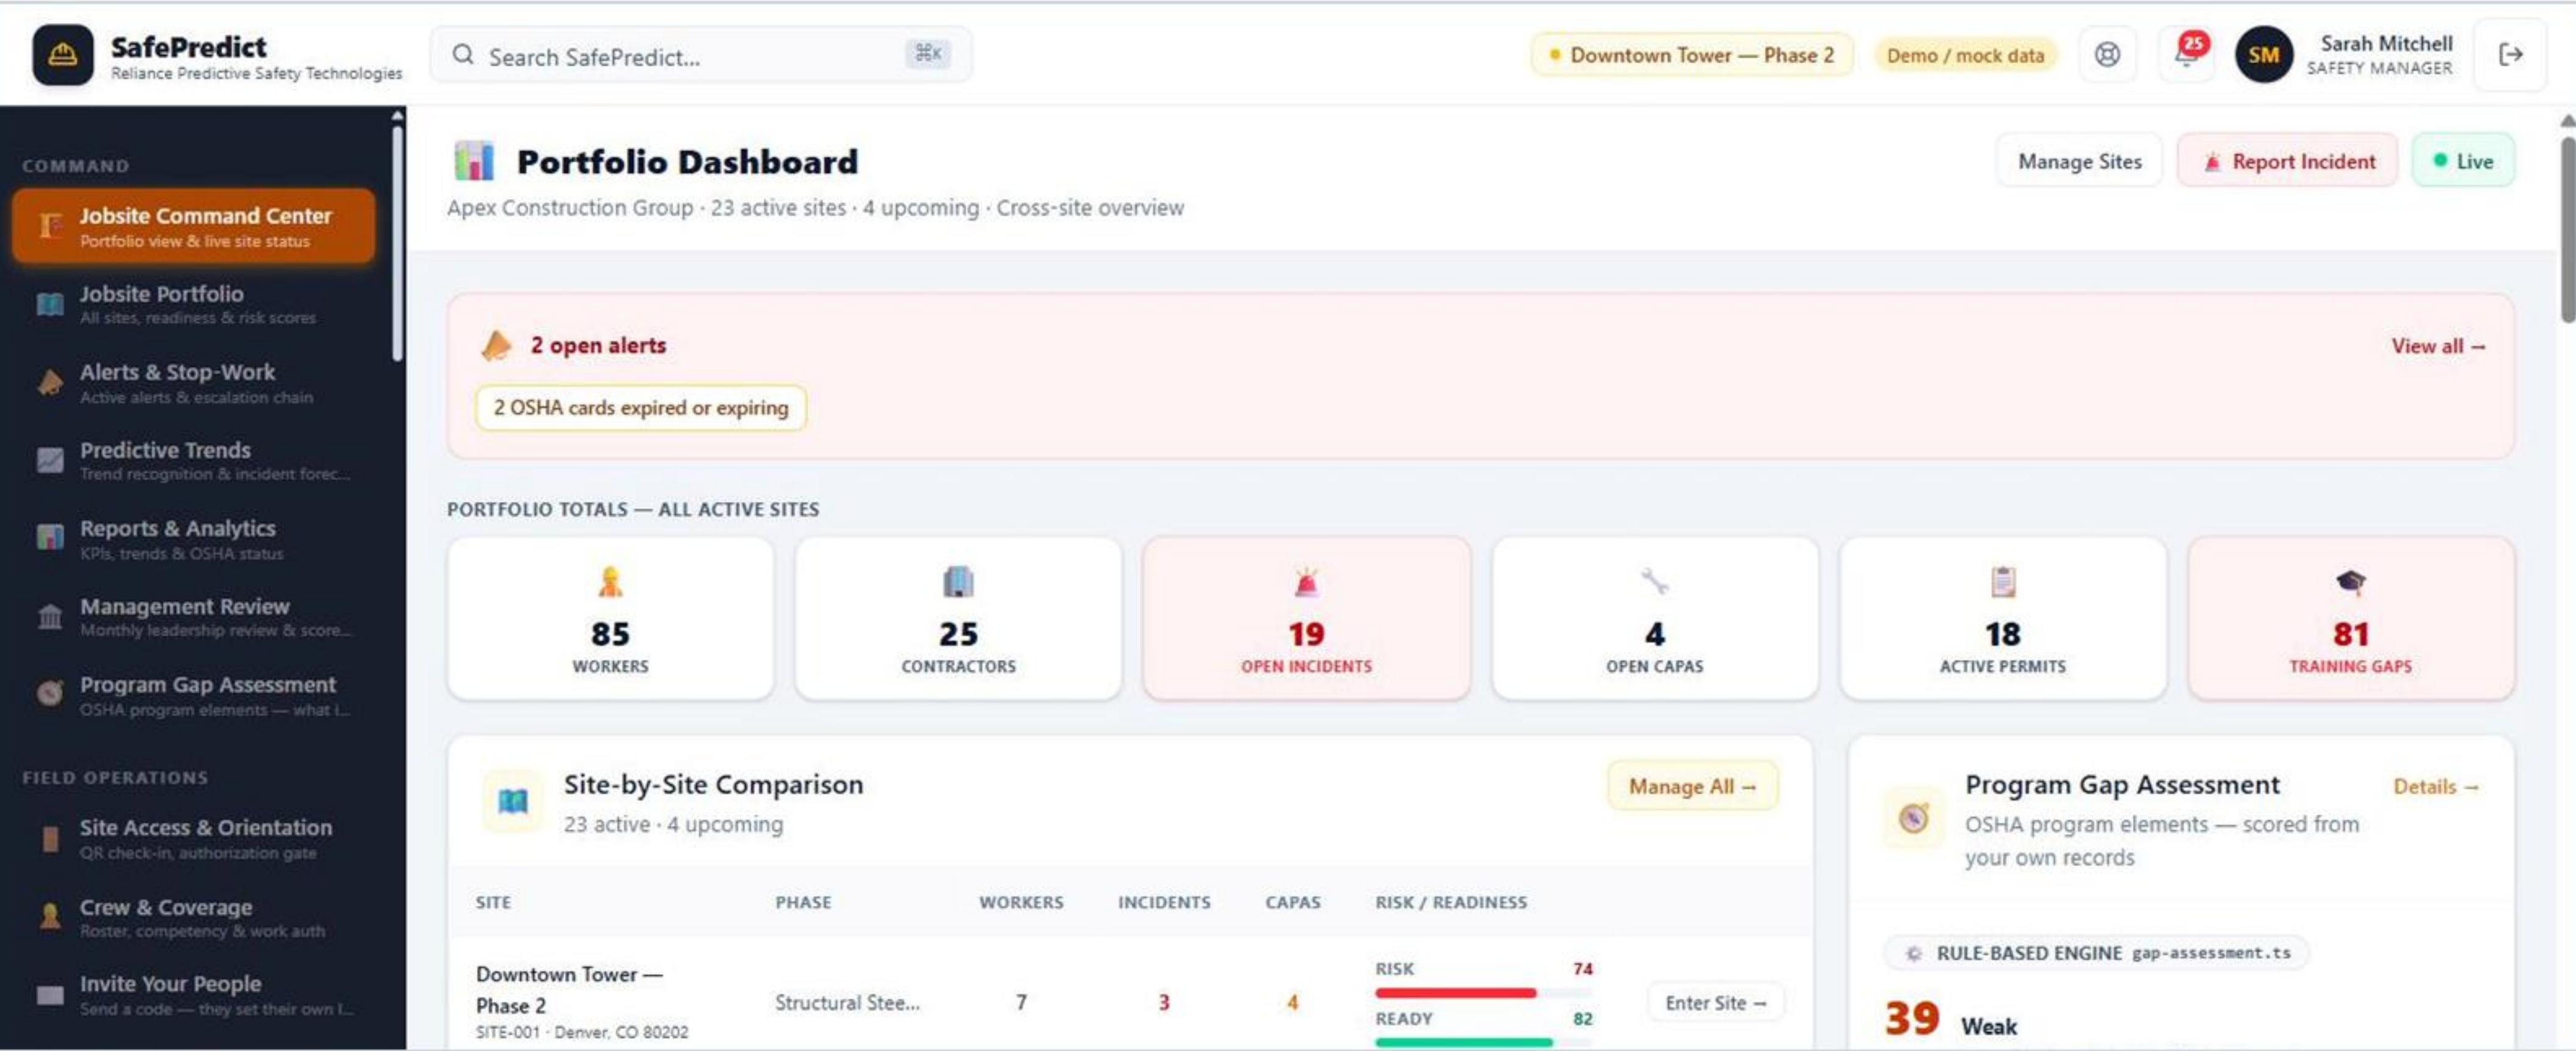

Same inputs, same answer, every time — and the inputs are the records your crews already file.

- Contractor risk scoring
- OSHA recordability · 29 CFR 1904
- Crew competency & authorization
- Predictive risk forecast
- Incident pattern & root cause
- Leading-indicator detection
- Human Signal Layer (HSL)
- Experience intelligence (EXP)
- Heat, weather & environmental
- Industrial hygiene · silica, noise, lead
- Foreman performance
- Phase risk
- Prequal gate
- Prequal document extraction
- DOT · 811 · locate quality
- Evolve — model accuracy
- Pre-shift 4-hour scan
- Work requirements
- Alert generation
- Predictive trends
- Operator qualification · 49 CFR 192
- Return-to-work
- Program gap assessment

No engine stores a verdict. Standing is derived on read, so a “compliant” flag cannot rot into a lie the day a cert lapses.

Every site, one screen, live

Portfolio totals are counted off the register itself — not a summary table someone remembers to refresh. Open alerts escalate on the record that created them.

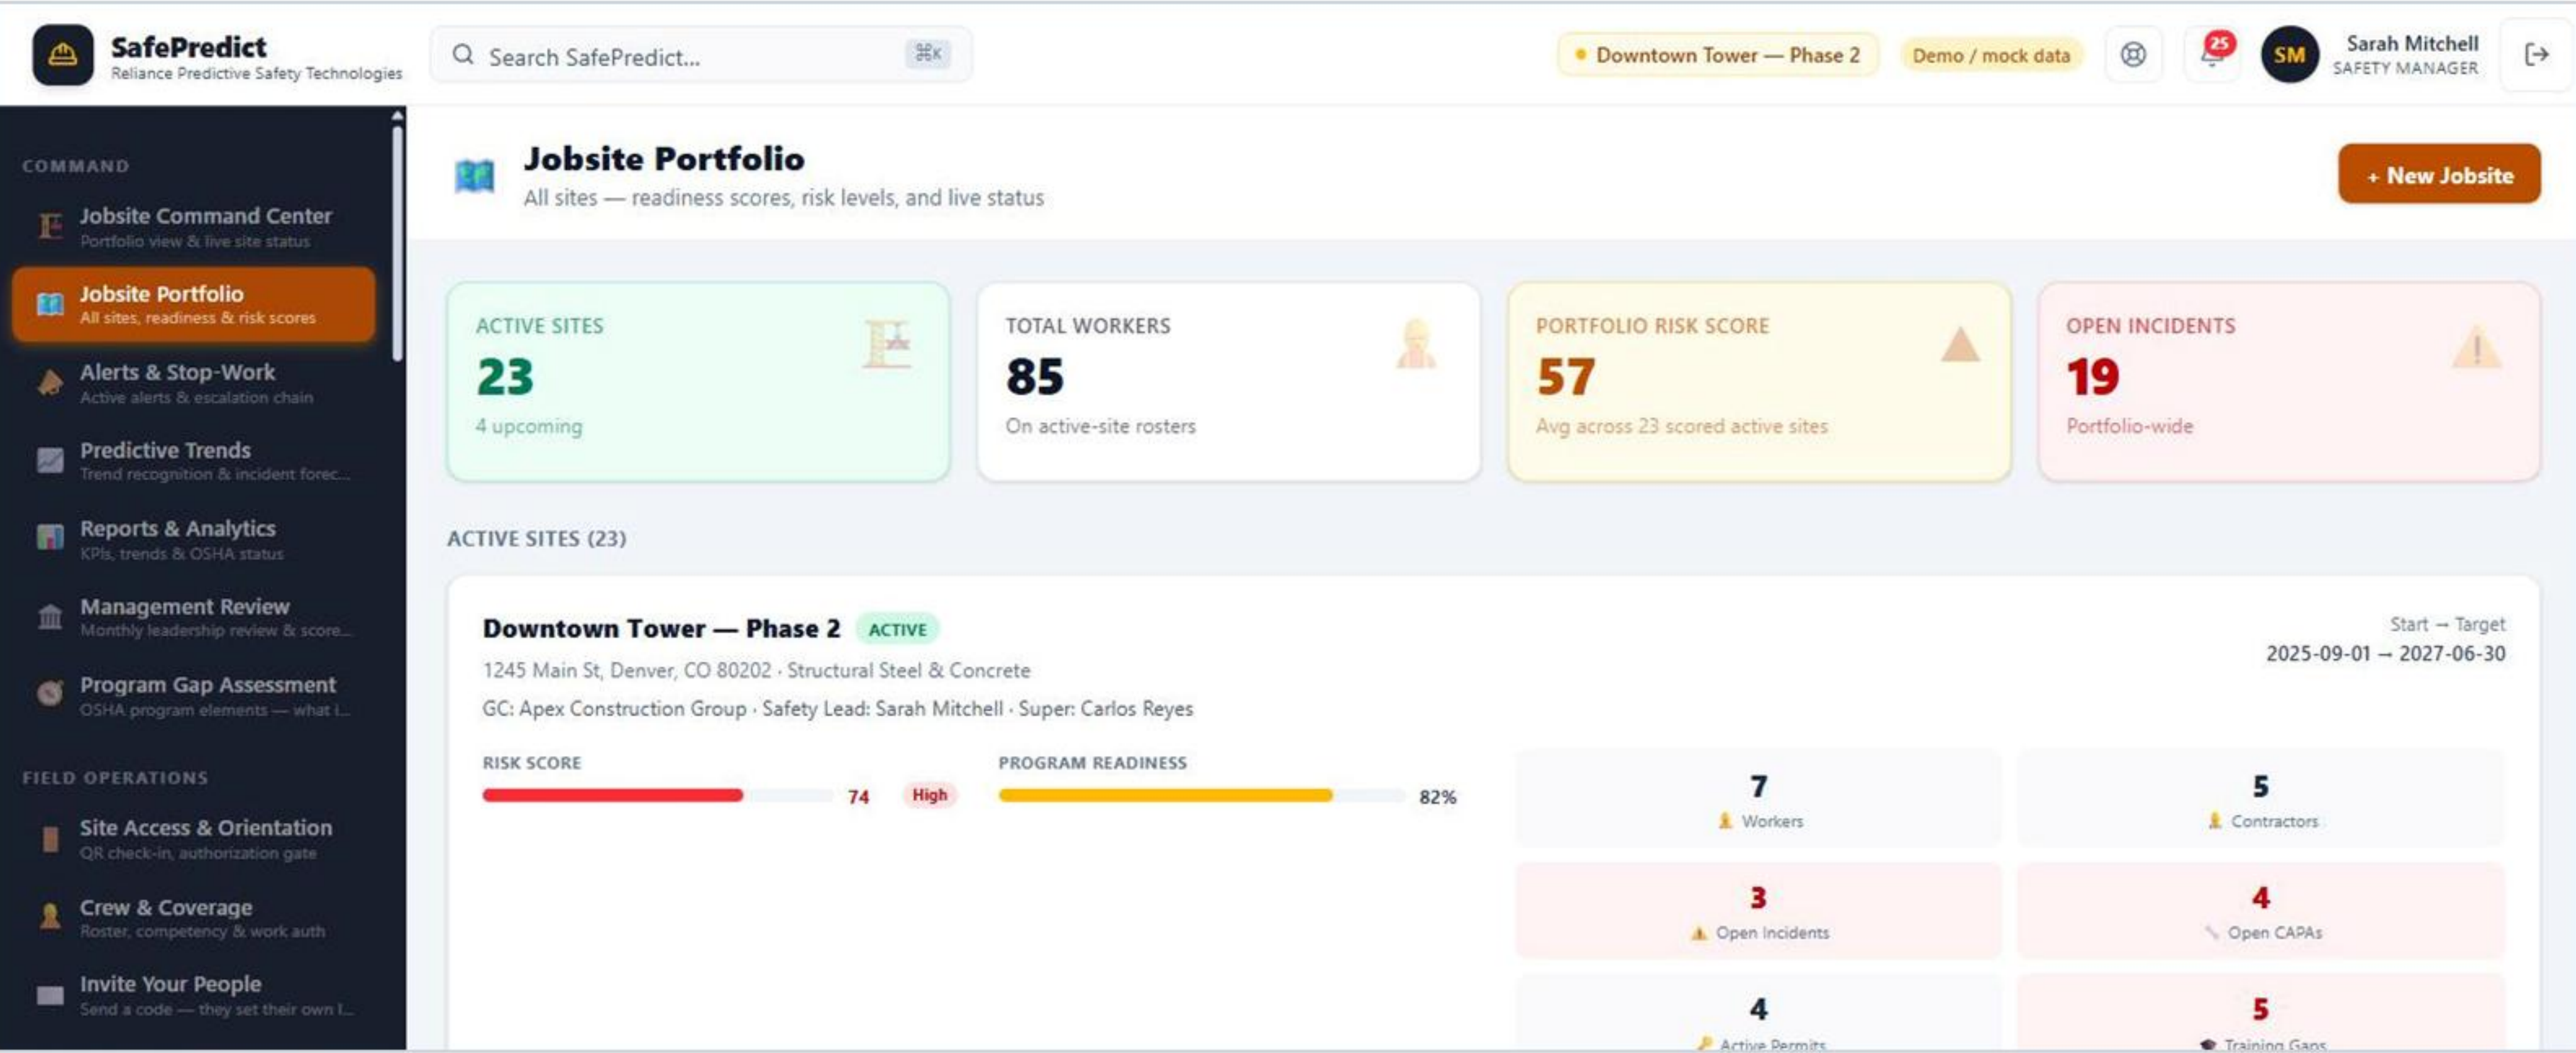

One number, one owner, one clock — and a click back to the record that produced it.

SafePredict · demo dataset

Site-by-site readiness and risk

Each site carries its own phase, crew, incident and CAPA counts, so a portfolio conversation drills straight into the jobsite driving the number.

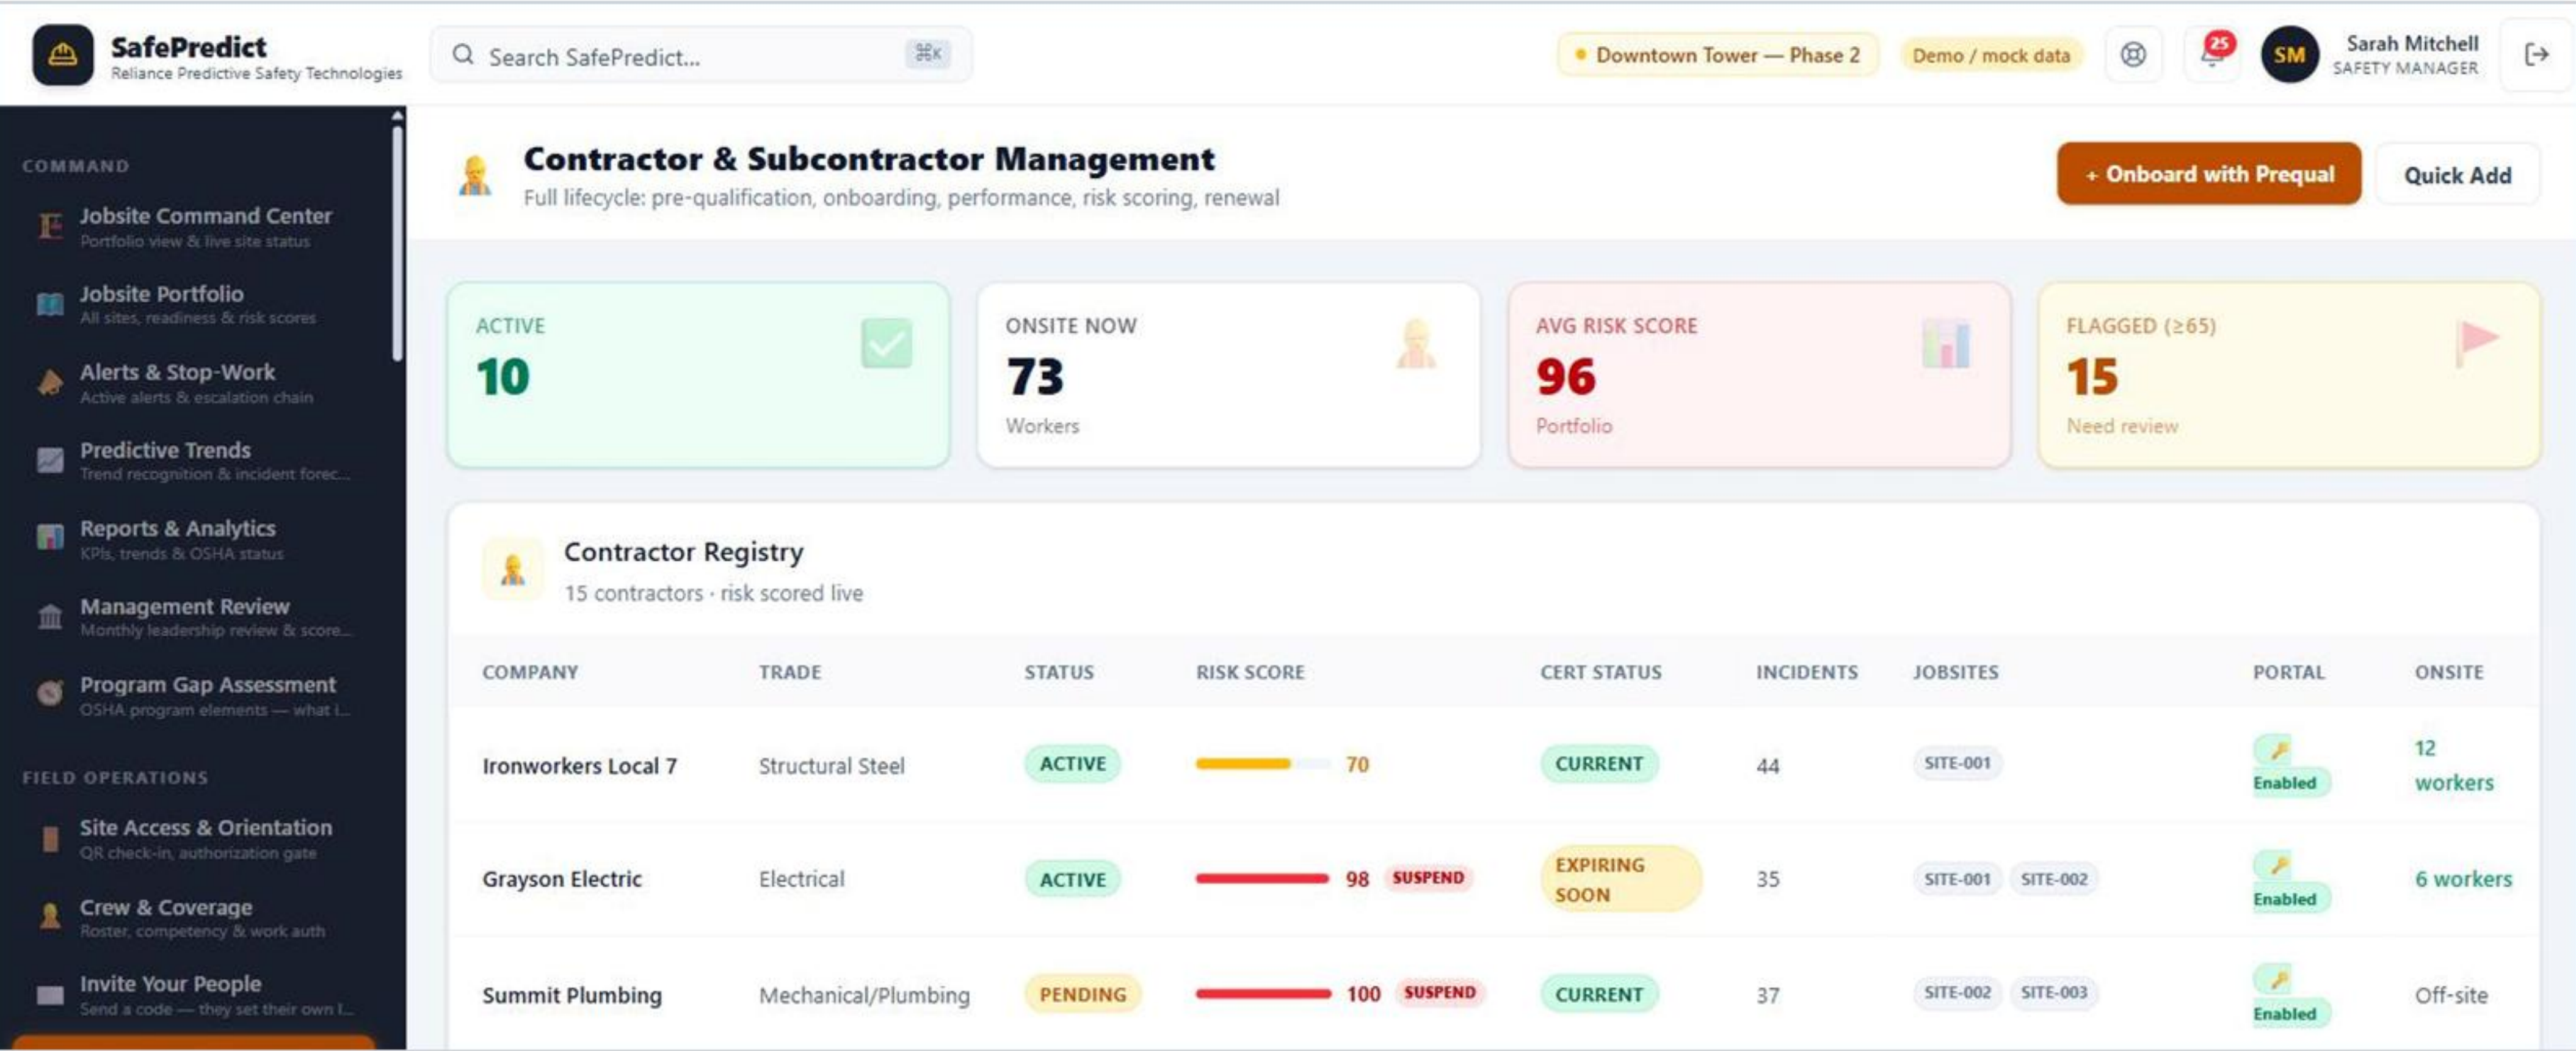

Readiness is derived on read from the site's live records — never a stored score someone has to refresh.

SafePredict · demo dataset

Which subcontractor is riskiest this morning

A 50-point baseline adjusted by incident history, training, insurance and prequal standing. The score moves when the record moves.

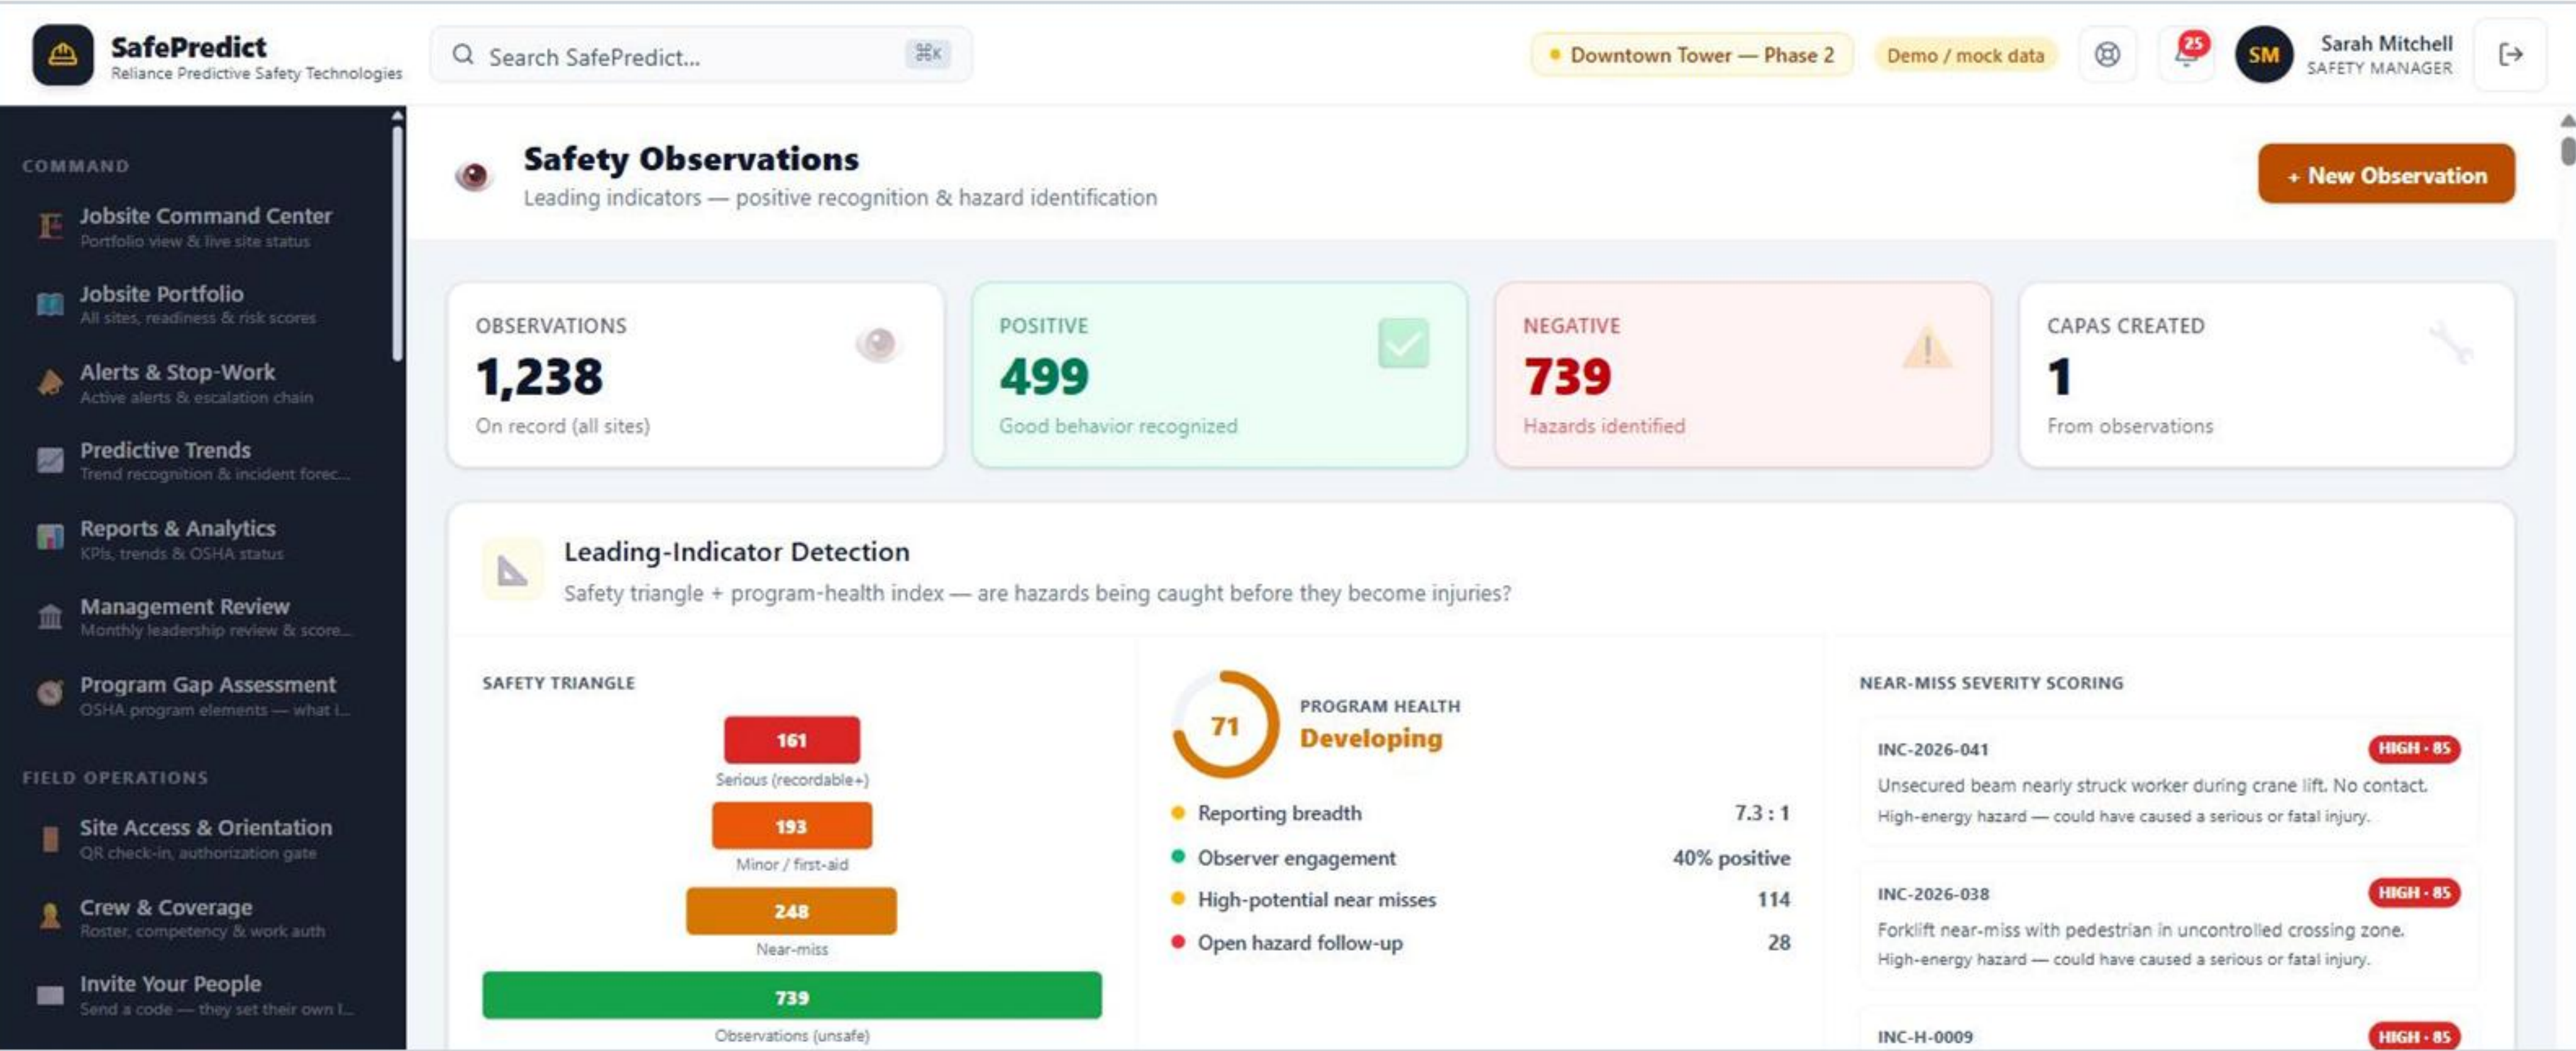

Prequal packets are read, gated and scored by three engines — one intake, three checks, one ranked list.

SafePredict · demo dataset

Catch it as an observation, not an incident

Field observations and near-misses are the cheapest safety data you will ever collect. The detection engine reads them as leading signal.

The safety triangle, the base-to-apex ratio and a program-health index — computed, not tallied by hand.

SafePredict · demo dataset

The 300 log, computed and defensible

An incident is filed against the site and crew it happened to, then run through the 1904 decision tree rather than argued case by case. Form 300, the 300A summary, Form 301 and severe-injury reporting all compute from that one record.

INCIDENTS & OSHA RECORDKEEPING

Where the next incident is most likely

Trend recognition and forecasting across sites, phases and trades — scored forward rather than reported backward, with the intervention that breaks the trend.

Anticipate → Forecast → Pre-empt. Every forecast is reconciled against what actually happened.

SafePredict · demo dataset

Only authorized, current crews reach the work

Task hazard and required competency are matched against who is actually qualified, so authorization is a gate rather than a checkbox — and expiring credentials surface against the work each worker is assigned.

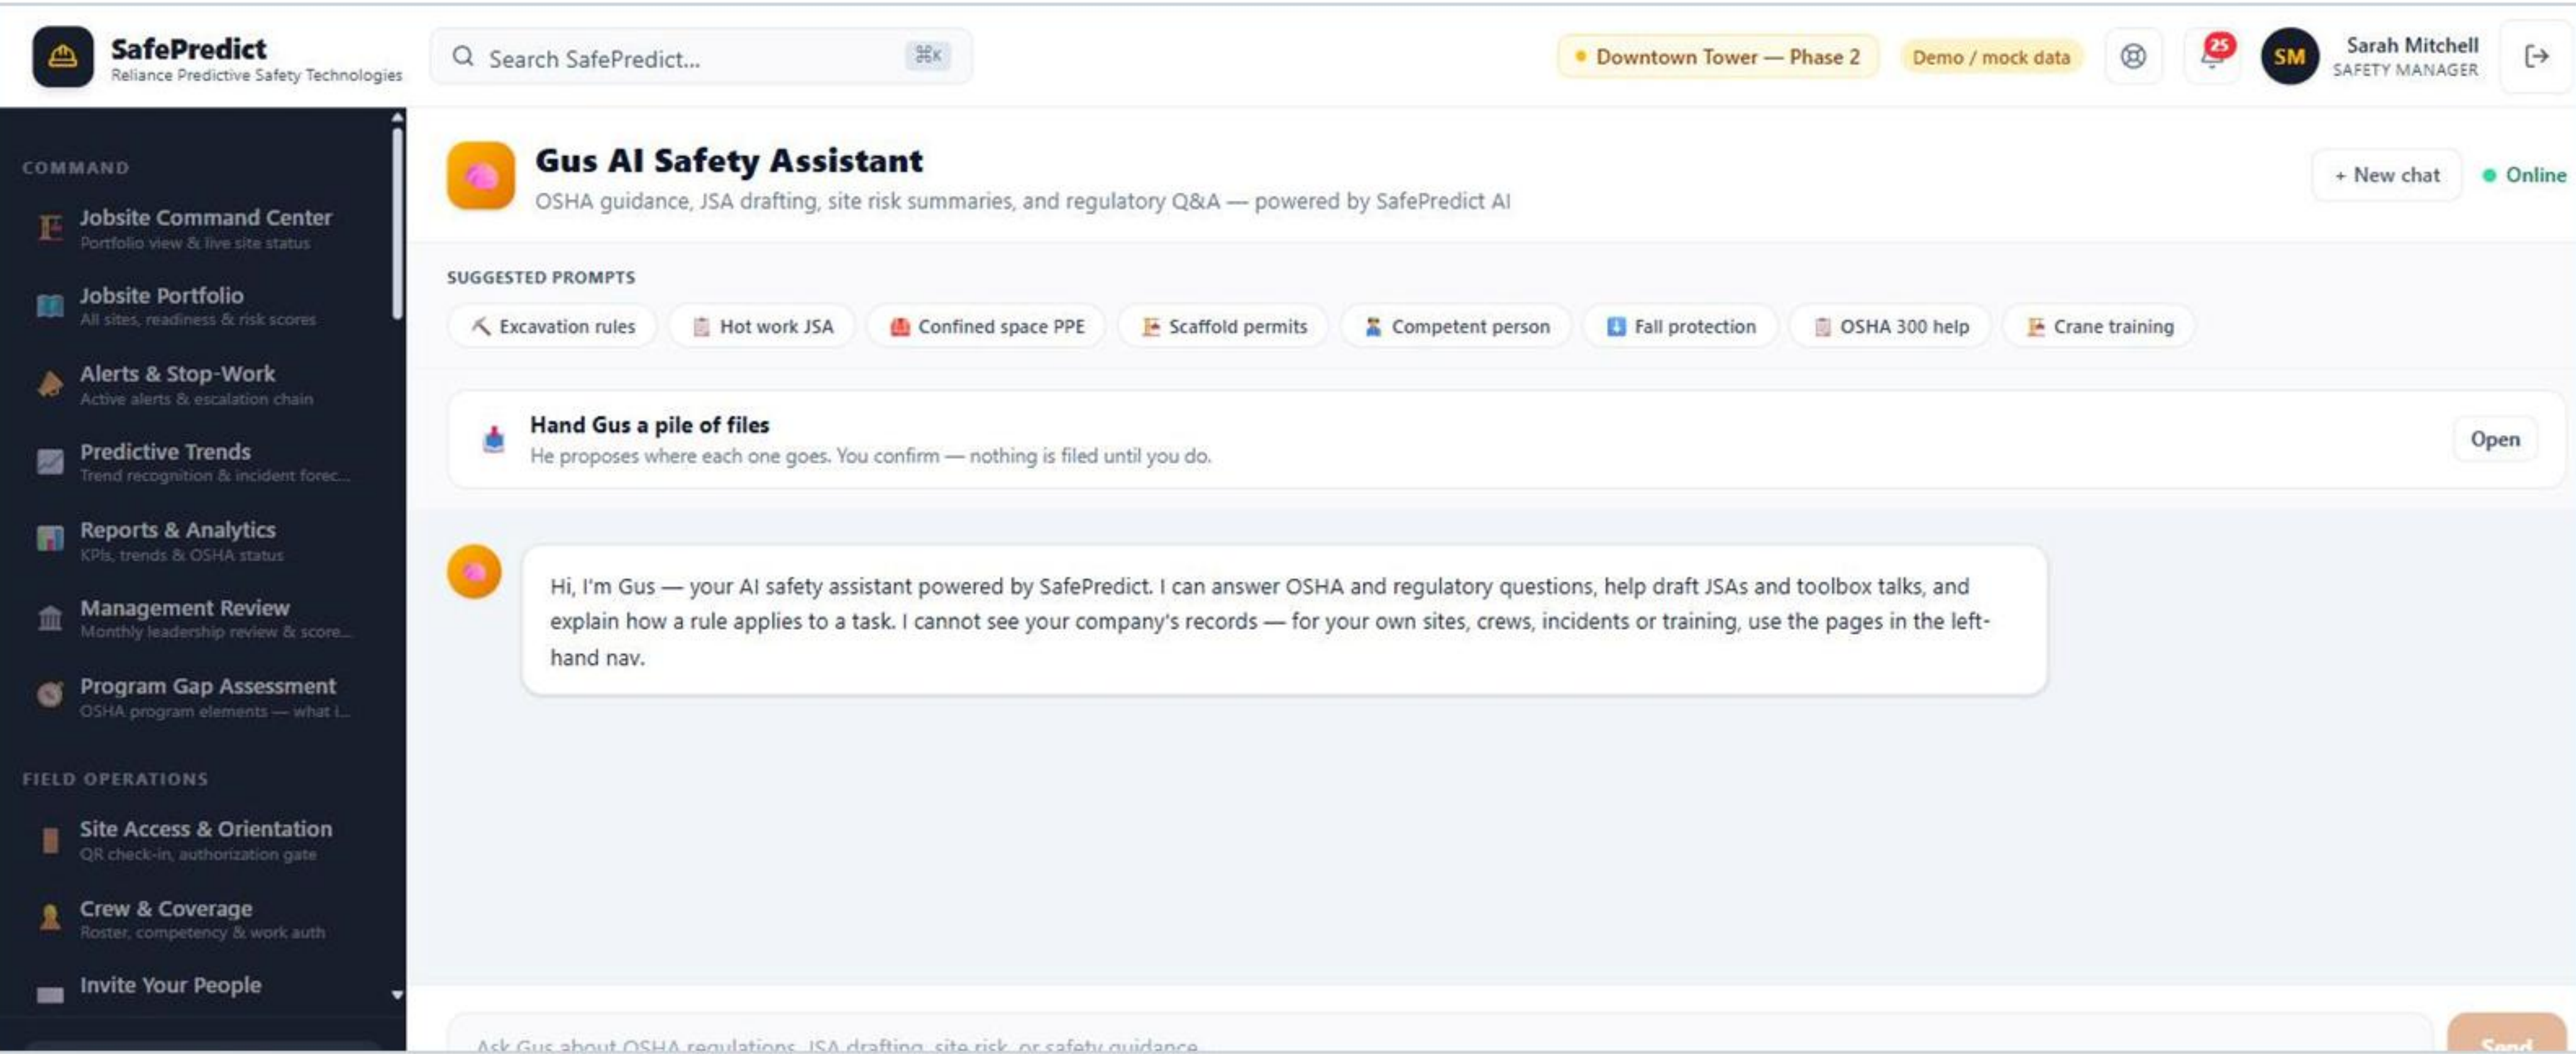

A four-check work-authorization gate. One check fails and the crew is not authorized.

SafePredict · demo dataset

Ask the platform a question in plain English

OSHA guidance, JSA drafting and site risk summaries — labeled as assistance, never as a substitute for the Safety Manager.

AI output is proposed, never applied. Nothing reaches a record until a person approves it.

SafePredict · demo dataset

Start on one jobsite.

01

Pick a live site

One active jobsite, its crews and its subs.

02

Load what exists

Prequal packets, certs and training records as they are today.

03

Run a month

Observations, permits, DAPs and incidents through the platform.

04

Compare

The 300 log it computes against the one you keep by hand.

BUILT MULTI-TENANT, ENFORCED SERVER-SIDE

Tenant isolation

Row-level security on every table. A company sees its own records and nothing else — enforced by the database, not the screen.

Layered enforcement

Role shapes the nav, a server read fence re-checks the URL, the server action re-checks the write, and RLS is the backstop.

Subcontractor portal

Each sub is fenced to the sites you assign, fail-closed. Documents flow both ways; reporting a hazard is never punished.

AI stays supervised

Model output is proposed, never applied. Nothing reaches a record until a person approves it.

Ready to modernize safety documentation and field visibility with a cleaner operating model?
